Repetition Lab Exercises

...building on Cinema/CinemaApp

Using Cinema and CinemaApp from last week, solve each of the problems below:

Cinema2App:

Modify the Cinema application to allow the user to check the cost of 2 tickets. The application should accept the age from the user 2 times, calculating and outputting the cost each time.

Cinema3App:

Modify the application to first ask the user how many tickets they would like to purchase. The application should then allow the user to check the cost of that number of tickets.

Cinema4App:

Modify the application again to allow the user to check the cost of one ticket and then ask the user would they like to check another. If they answer yes, the application should run again, if they answer no, the application should end.

Cinema5App:

Modify Cinema4App to keep a running total of all tickets that the user wishes to buy. When the programme exits the loop, the total cost should be displayed to the user.

Cinema6App:

Modify Cinema5App so that there is an upper limit of 4 tickets per person. When this limit is reached, the user should not be able to purchase any more tickets.
